SEND ETHER

The difference between .send(), .transfer() and .call.value()()

.SEND() AND .CALL.VALUE()()

- Low Level functions

- Return boolean

- Source for „re-entry attacks"
  - If not done correctly

- Do not propagate Exceptions

- .send() sends only minimum amount of gas (2300)

.TRANSFER()

- Preferred for transferring ether

- Propagate GAS

- Propagate Exceptions

EXAMPLE

- In the github repository

- And on a gist:

- https://gist.github.com/tomw1808/3e4075cbc517ea16bf01474ddce91286
